Preventing Preterm Birth

Birth before 37 weeks of pregnancy is considered 'preterm'.

In Canada, about 1 in 12 live births are preterm. It is important to be informed.

Your health plan should include healthy weight gain, safe exercise and good nutrition. It is important to keep all scheduled appointments with your doctor or care provider.

If you fall into one of these risk categories, it is important to speak to your doctor or a care provider so your health can be monitored and a care plan created.

You were born preterm	Are experiencing vaginal bleeding during pregnancy	Have high blood pressure, diabetes, or kidney disease	Are over-weight or under-weight before pregnancy
Discuss with a care provider.	Contact a care provider.	You may be prescribed Aspirin (after 12 weeks pregnancy). Do not self medicate.	Your health plan should include healthy weight gain, safe exercise and good nutrition.
Had a pregnancy less than 12 months ago	Are pregnant with multiples (two or more)	Had surgery to remove part of your cervix	Use drugs, cigarettes, alcohol
Spacing pregnancies can reduce the risk.	Progesterone may be prescribed if the length of your cervix shortens.	Contact a care provider.	Seek resources and options for support and control.
Have high levels of stress or depression	Have a pre-existing medical condition	Have a bladder or kidney infection during pregnancy	
Seek mental health resources, support, and counselling.	Contact a care provider or specialist if you a planning another pregnancy.	You may be prescribed antibiotics.	If you have had a previous preterm birth please refer to page 2 (reverse)
